

1. UNIQUE EPIC SPECIFICATION

EPIC-04: Offer Letter Processing & Placement Confirmation

Lab 1 Traceability: FR-005 & NFR-001 & UC-05, UC-06 | Methodology: Agile-Scrum (Fibonacci Story Points & Planning Poker)

Automate the generation, verification, and distribution of official employment and internship offer letters. Provide cryptographic security for salary and candidate records using AES-256 encryption at rest, support student offer acceptance/rejection workflows with decision timeouts, enforce the university's strict 'One-Student-One-Offer' placement policy, and generate consolidated placement analytics.

2. USER STORIES & ESTIMATION TABLE

Total Epic Scope: 18 Story Points		Sprint 1 Commitment: 11 Story Points	Sprint 2 Commitment: 7 Story Points	Estimation Technique: Planning Poker (Fibonacci Scale)	
Issue ID	User Story Description (As a / I want / So that)	Acceptance Criteria	Priority	Points	Sprint
CPIP-401	As a placement officer, I want generate standardized, branded offer letters populated with candidate name, USN, job title, CTC breakup, and joining date from pre-configured drive templates, So that official offers are issued promptly and accurately.	PASS: System renders formal offer letters containing exact candidate and salary data within 3 seconds. FAIL: An offer letter is generated for a candidate not marked 'Selected'.	HIGH	5	SPRINT 1
CPIP-402	As a placement officer, I want all generated offer records, compensation packages, and student acceptance letters to be encrypted at rest using AES-256, So that confidential financial and personal data comply with institutional security standards (NFR-001).	PASS: Verification confirms database records and PDF files on disk are AES-256 encrypted. FAIL: Unencrypted plaintext compensation documents exist on storage.	HIGH	3	SPRINT 1
CPIP-403	As a student applicant, I want view my official offer letter online and formally record my decision (Accept or Decline) before the offer expiry deadline, So that my placement status is legally and systematically confirmed.	PASS: Student can view authenticated document and click Accept/Decline with two-factor confirmation. FAIL: Student can submit acceptance after the expiry deadline.	HIGH	3	SPRINT 1
CPIP-404	As a placement officer, I want the system to automatically freeze student accounts and withdraw active applications across other drives once an offer is accepted, So that the university's strict 'One-Student-One-Offer' policy is automatically enforced.	PASS: Candidate profile status transitions to 'Placed' and all pending drive registrations are cancelled. FAIL: An already-placed student registers for another placement drive.	HIGH	5	SPRINT 2
CPIP-405	As a placement officer, I want generate real-time analytics reports showing total offers accepted, average/highest CTC, and branch-wise placement percentages, So that institutional placement metrics can be reviewed by university leadership.	PASS: System produces accurate graphical summaries and exportable statistical spreadsheets. FAIL: Discrepancy between accepted offers and final summary counts.	MEDIUM	2	SPRINT 2

3. JIRA WORKSPACE DELIVERABLES & SCREENSHOTS

Demonstration screenshots captured from Atlassian Jira workspace for **EPIC-04**.

Deliverable 1: Jira Backlog with Epics and User Stories

Backlog View (Keyboard shortcut 'E' for Epic Panel)

The screenshot shows the Jira Backlog view for the 'CPIP board'. On the left, there's a sidebar with navigation options like 'For you', 'Recent', 'Starred', 'Apps', 'Plans', 'SPACES', and 'FILTERS'. The main area is divided into two panels. The left panel, titled 'Epics (4 Team Epics)', lists four epics: 'EPIC-01: Automated Resume Parsing & Skill Extraction', 'EPIC-02: Multi-Tier CGPA & Academic Eligibility Filtering', 'EPIC-03: Multi-Round Interview Queue & Assessment Management', and 'EPIC-04: Offer Letter Processing & Placement Confirmation'. The right panel, titled 'Backlog (9 work items)', shows a list of tasks with checkboxes, titles, and status indicators. A 'Create sprint' button is visible at the top right of the backlog panel.

Deliverable 2: Story Point Assignments

Fibonacci Planning Poker Estimates

The screenshot shows the Jira Story Point Assignments view for the 'CPIP board'. The main area displays the details for 'CPIP-402: all generated offer records, compensation packages, and student acceptance letters to be encrypted at rest using AES-256'. The 'DESCRIPTION' section contains a detailed description of the task. The 'ACCEPTANCE CRITERIA' section lists two criteria: 'PASS: Verification confirms database records and PDF files on disk are AES-256 encrypted.' and 'FAIL: Unencrypted plaintext compensation documents exist on storage.' The 'ACTIVITY' section shows a list of comments and work log entries. On the right, there's a sidebar with metadata including 'STATUS' (To Do), 'STORY POINTS (FIBONACCI ESTIMATE)' (3), 'PRIORITY' (High), 'PARENT EPIC' (EPIC-04: Offer Letter Processing & Placement Confirmation), 'ASSIGNEE' (Dhruv Rajagopalan), 'SPRINT' (CPIP Sprint 1), and 'ESTIMATION METHOD' (Planning Poker Consensus).

Deliverable 4: Burndown Chart

Reports > Burndown Chart (Remaining SP vs. Guideline)

4. REFLECTION QUESTIONS

1. Did your estimations reflect the actual effort?

Yes, the story points reflected the actual implementation effort very well. Story CPIP-401 was estimated at 5 points due to dynamic templating across variable compensation structures (base pay, bonuses, stock grants). Story CPIP-402 (AES-256 Encryption) was estimated at 3 points because standard cryptographic libraries could be integrated, though ensuring proper key management required focused attention. Planning Poker discussions helped clarify that security compliance (NFR-001) could not be compromised, justifying our estimations.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized strictly in the order of business value and operational sequence. Issuing valid offers (CPIP-401), securing sensitive data (CPIP-402), and providing candidate acceptance mechanisms (CPIP-403) represent the core pipeline completion without which the placement system is incomplete. The policy freezing automation (CPIP-404) and administrative reporting (CPIP-405) were planned for Sprint 2 once valid offers were actively recorded.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned closely with our initial plan. We targeted 11 story points across three user stories for Sprint 1. All three stories moved progressively through To Do -> In Progress -> Done within the 1-week time-box. By adhering to the definition of done (including cryptographic verification), the sprint reached a successful, verifiable conclusion.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed a brief plateau early in the sprint as encryption setup and data models were initialized, followed by steady story completions that brought remaining effort to zero right at the end of the sprint. This indicated that our team has a reliable capacity of 11 story points per sprint when requirements and technical architecture are clearly specified.
