

1. UNIQUE EPIC SPECIFICATION

EPIC-01: Automated Resume Parsing & Skill Extraction

Lab 1 Traceability: FR-001 & UC-01 | Methodology: Agile-Scrum (Fibonacci Story Points & Planning Poker)

Enable students to upload PDF resumes into the campus placement portal, automatically validate document integrity, extract standardized skill tags, educational qualifications, and coursework metrics using natural language extraction, and match candidate competencies directly against active company job profiles.

2. USER STORIES & ESTIMATION TABLE

Total Epic Scope: 17 Story Points		Sprint 1 Commitment: 10 Story Points	Sprint 2 Commitment: 7 Story Points	Estimation Technique: Planning Poker (Fibonacci Scale)	
Issue ID	User Story Description (As a / I want / So that)	Acceptance Criteria	Priority	Points	Sprint
CPIP-101	As a student applicant, I want upload my PDF resume with format and file size validation, So that my candidate profile can be parsed cleanly without corrupting the placement database.	PASS: File must be valid PDF under 5MB. Clear confirmation is displayed upon upload. FAIL: Corrupt or encrypted files without password bypass are blocked.	HIGH	3	SPRINT 1
CPIP-102	As a placement officer, I want the system to automatically parse uploaded resumes and extract normalized technical skills and certifications, So that applicant profiles are structured uniformly across departments.	PASS: System extracts skill tags (Python, C++, SQL, Machine Learning) within 5 seconds for compliant PDF files. FAIL: Non-standard resume sections cause extraction timeouts.	HIGH	5	SPRINT 1
CPIP-103	As a student applicant, I want review the extracted skill tags on my profile dashboard and confirm or adjust them, So that my profile accurately reflects my competencies before applying to drives.	PASS: Student can view parsed tags in editable tag-chips and save updates. FAIL: Unsaved changes persist without confirmation prompt.	MEDIUM	2	SPRINT 1
CPIP-104	As a corporate recruiter, I want the system to match candidate skill tags against job description requirements and highlight high-match candidates, So that our recruitment team can prioritize top-tier candidates for initial screening.	PASS: Candidates are ranked by percentage skill overlap with configured job description keywords. FAIL: Unmatched keywords trigger false-positive eligibility.	HIGH	5	SPRINT 2
CPIP-105	As a student applicant, I want clear, actionable error feedback if my uploaded resume is unreadable or fails text extraction, So that I can re-upload a compliant resume before the placement registration deadline.	PASS: Specific error messages (e.g., 'Scanned image PDF detected, please upload searchable text PDF') displayed immediately. FAIL: Silent upload failure with no notification.	LOW	2	SPRINT 2

3. JIRA WORKSPACE DELIVERABLES & SCREENSHOTS

Demonstration screenshots captured from Atlassian Jira workspace for **EPIC-01**.

Deliverable 1: Jira Backlog with Epics and User Stories

Backlog View (Keyboard shortcut 'E' for Epic Panel)

The screenshot displays the Jira Backlog view for the 'CPIP board'. The left sidebar shows the project structure with 'CPIP board' selected. The main area shows a backlog of 5 work items under the epic 'EPIC-01: Automated Resume Parsing & Skill Extraction'. The work items are listed with their IDs, titles, and priorities. The epic panel on the left shows the epic details, including the key, work items, completed status, and estimate.

ID	Title	Priority
CPIP-101	Story 1: upload my PDF resume with format and file size validation	High
CPIP-102	Story 2: the system to automatically parse uploaded resumes and extract normalized technical skills and certifications	High
CPIP-103	Story 3: review the extracted skill tags on my profile dashboard and confirm or adjust them	Medium
CPIP-104	Story 4: the system to match candidate skill tags against job description requirements and highlight high-match candidates	High
CPIP-105	Story 5: clear, actionable error feedback if my uploaded resume is unreadable or fails test extraction	Medium

Deliverable 2: Story Point Assignments

Fibonacci Planning Poker Estimates

The screenshot displays the Jira Story view for 'CPIP-102'. The left sidebar shows the project structure with 'CPIP board' selected. The main area shows the story details, including the title, description, acceptance criteria, and activity. The right sidebar shows the 'STORY POINTS (FIBONACCI ESTIMATE)' panel, which includes the status, priority, parent epic, assignee, sprint, and estimation method.

STORY POINTS (FIBONACCI ESTIMATE)

STATUS: TO DO

PRIORITY: High

PARENT EPIC: EPIC-01: Automated Resume Parsing & Skill Extraction

ASSIGNEE: Dilpan Y

SPRINT: CPIP Sprint 1

ESTIMATION METHOD: Planning Poker Consensus

4. REFLECTION QUESTIONS

1. Did your estimations reflect the actual effort?

Yes, our estimations generally reflected the actual effort, though certain complexities emerged during parsing. Story CPIP-101 (Resume Upload) was straightforward file validation estimated at 3 story points, which matched the implementation effort. Story CPIP-102 (Automated Skill Extraction) was estimated at 5 points due to uncertainty regarding heterogeneous PDF layouts (single-column vs. two-column and scanned files). Planning Poker helped surface this uncertainty beforehand, and 5 points accurately captured the effort required to tune text-parsing regular expressions and dictionary matching. Story CPIP-103 (2 points) was a low-complexity UI review component that finished well within the allocated time.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized strictly around functional dependencies and core end-user value. Ingestion (CPIP-101) and extraction (CPIP-102) were marked High priority and placed at the top of the backlog because subsequent recruitment workflows (eligibility filtering in Epic 2 and interview queue management in Epic 3) cannot execute without structured candidate profile data. Candidate profile confirmation (CPIP-103) was scheduled next to ensure data accuracy. The downstream matching algorithm (CPIP-104) and edge-case handling (CPIP-105) were planned for Sprint 2, establishing a logical, incremental delivery sequence.

3. How did your simulated sprint align with your plan?

The simulated sprint closely mirrored our sprint commitment. Sprint 1 committed 10 story points across three core user stories. All 3 stories progressed smoothly from To Do to In Progress and ultimately to Done within the 1-week time-box. By avoiding scope creep and strictly holding recruiter matching stories for Sprint 2, the team avoided sprint bloat and achieved an uninterrupted burndown trajectory.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart illustrated a steady downward slope across the sprint cycle. The team demonstrated a sustainable velocity of approximately 10 story points per 1-week sprint. The absence of mid-sprint upward spikes confirmed that the sprint backlog was locked and no unplanned scope crept in. A brief plateau was observed mid-sprint while resolving multi-column PDF parsing in CPIP-102, after which completed story points burned down sharply to zero upon resolution, verifying that our team's realistic capacity is around 10-12 story points per 1-week sprint.
