

1. UNIQUE EPIC SPECIFICATION

EPIC-02: Multi-Tier CGPA & Academic Eligibility Filtering

Lab 1 Traceability: FR-002 & UC-02, UC-07 | Methodology: Agile-Scrum (Fibonacci Story Points & Planning Poker)

Provide robust rule-configuration capabilities for recruiters and placement officers to establish drive-specific qualification parameters (minimum CGPA thresholds, allowable active/dead backlogs, branch eligibility) and run an automated rules evaluation engine that assesses applicants in real time while maintaining complete audit trails.

2. USER STORIES & ESTIMATION TABLE

Total Epic Scope: 18 Story Points		Sprint 1 Commitment: 10 Story Points	Sprint 2 Commitment: 8 Story Points	Estimation Technique: Planning Poker (Fibonacci Scale)	
Issue ID	User Story Description (As a / I want / So that)	Acceptance Criteria	Priority	Points	Sprint
CPIP-201	As a corporate recruiter, I want configure placement drive eligibility parameters (cut-off CGPA, maximum backlogs, eligible engineering departments), So that the system automatically screens applicant pools against company requirements.	PASS: Recruiter can set multiple thresholds (CGPA >= 7.75, active backlogs = 0) and persist rule configurations. FAIL: Invalid thresholds (e.g., negative CGPA) are saved without validation.	HIGH	5	SPRINT 1
CPIP-202	As a placement officer, I want an automated rules evaluation engine to assess applicant academic records against active drive rules, So that hundreds of applicant records can be screened deterministically within seconds.	PASS: 100% of candidate profiles are categorized as Eligible or Ineligible matching exact criteria within 5 seconds. FAIL: A candidate with active backlogs is marked eligible.	HIGH	5	SPRINT 1
CPIP-203	As a student applicant, I want view my eligibility status for each upcoming company drive alongside explicit disqualification reasons, So that I have full transparency regarding why I can or cannot register for a drive.	PASS: Student dashboard displays clear status ('Eligible' or 'Ineligible: CGPA 7.42 < 7.75 required'). FAIL: Disqualification reason is empty or generic error message.	MEDIUM	3	SPRINT 2
CPIP-204	As a student applicant, I want submit a discrepancy resolution request with supporting grade sheet updates, So that my placement eligibility can be recalculated following re-evaluation or backlog clearance.	PASS: Student submits re-evaluation ticket with grade card upload; placement officer receives approval prompt. FAIL: Dispute can be raised for non-existent placement drives.	LOW	3	SPRINT 2
CPIP-205	As a placement officer, I want export an auditable compliance report containing all eligibility screening decisions per drive, So that the placement cell can satisfy institutional auditing and corporate fairness criteria.	PASS: System exports CSV/PDF containing applicant USN, evaluated CGPA, backlog status, and final eligibility flag. FAIL: Incomplete report generated omitting disqualified candidates.	MEDIUM	2	SPRINT 2

3. JIRA WORKSPACE DELIVERABLES & SCREENSHOTS

Demonstration screenshots captured from Atlassian Jira workspace for **EPIC-02**.

Deliverable 1: Jira Backlog with Epics and User Stories

Backlog View (Keyboard shortcut 'E' for Epic Panel)

Deliverable 2: Story Point Assignments

Fibonacci Planning Poker Estimates

4. REFLECTION QUESTIONS

1. Did your estimations reflect the actual effort?

Yes, the story point estimates closely mirrored the complexity of the requirements. Story CPIP-201 was estimated at 5 points due to multiple configurable parameters across different degree branches and tier cutoffs, which required intricate schema design. Story CPIP-202 (Rule Evaluation Engine) was also given 5 points because boundary conditions (rounding of CGPA, distinguishing current active vs. previously cleared backlog history) posed significant algorithmic complexity. Planning Poker debates between team members helped unpack these corner cases before development began, ensuring our estimates remained accurate.

2. Was your backlog well-prioritized?

Yes, the backlog strictly prioritized the core business engine ahead of auxiliary features. Setting drive criteria (CPIP-201) and the automated rule evaluation engine (CPIP-202) formed the critical foundation without which neither interview scheduling nor candidate dashboards could function. Secondary user feedback mechanisms like the student-facing discrepancy dashboard (CPIP-203), re-evaluation disputes (CPIP-204), and compliance audit reporting (CPIP-205) were planned for Sprint 2 once the core logic was rock solid.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned smoothly with our initial plan. We targeted 10 story points across two major backend stories in Sprint 1. The work transitioned cleanly from To Do to In Progress and into Done. By keeping the scope bounded strictly to the evaluation engine, we avoided mid-sprint churn and delivered functional automated filtering within the simulated 1-week timeline.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart exhibited a clean step-down pattern, burning down 5 points upon completing rule configuration, followed by the remaining 5 points when the rule engine passed test execution. This confirmed that our team's optimal sprint capacity is around 10-12 story points per week. The chart also underscored that for complex 5-point stories, progress appears static until integration and verification are finalized; in future iterations, breaking 5-point stories into smaller 2-3 point subtasks will produce an even smoother burndown line.
